Keri Systems Releases Doors.NET

Keri Systems has released a new access control software program designed to manage systems using its TCP/IP-based NXT controller hardware family with built-in Ethernet connectivity. Much like its predecessor (Doors, for use with PXL-500 Tiger Controllers), Doors.NET has an intuitive user interface and uses a handy spreadsheet operation for many common tasks. It was designed natively on Microsoft's .NET platform for superior speed performance and security, has Client/Server functionality, and uses MS Sequel as its database.

All communication between the database and the application are accomplished through Stored Procedures, again to enhance the speed and robustness of the system. Doors.NET allows for an unlimited number of connected workstations using Thin Client architecture to push information out to the Clients. In addition to a sophisticated set of access control features that will continue to grow, the software includes options for Photo Badging, Digital Video Recording and Monitoring, and a number of other integrated features.

The NXT controller hardware that Doors.NET manages features 2 and 4 door controller versions with direct Ethernet connectivity via a built-in TCP/IP port, along with I/O modules that allow flexibility in both linkage macros door function connectivity, and bi-directional proximity readers that allow for supervision and long distances from the controller.

Keri Systems is a leading provider of integrated card access control, with integrated telephone entry, video badging systems, biometrics and digital video recording. Located in the heart of California's famed Silicon Valley at 2305 Bering Drive., San Jose, CA, USA, the company continues to enhance its leadership in controller and proximity technology by offering a suite of products and services for customers requiring more than just basic access control hardware and software.
